

# Uterine inversion – some procedures to prevent reinversion

## Inverze dělohy – některé postupy k prevenci reinverze

Dear Editors,

Uhlířová and Málek [1] reported a patient with postpartum uterine inversion who required laparotomic repositioning. Importantly, uterine inversion can recur after the successful repositioning [2–4], referred to as acute uterine reinversion. The inversion and its repositioning have already caused marked bleeding and circulatory collapse, and thus, reinversion-occurrence is life-threatening. How to prevent acute reinversion? Uhlířová and Málek state that uterotonics should be administered to prevent reinversion, with which I agree. I would like to add some procedures to prevent reinversion.

One solution is to extinguish “room” of reinversion. Intrauterine gauze-packing has been used for a long time; however, filling the entire uterine cavity with gauze requires some experiences. We have been using intrauterine haemostatic balloon to prevent reinversion [5]. Some balloons designed for intrauterine haemostasis (Bakri balloon) may be appropriate; however, any other balloons including Foley or condom catheters can be used in an emergent setting.

Another solution is to extinguish “exit” of reinverting uterus. We have been employing the “holding the cervix technique” for a long time, in which the anterior and posterior cervical lips are held by a sponge forceps, thereby closing the cervical canal [6,7]. There remains no exit of the reinverting uterus, preventing reinversion. However, this technique may not prevent “par-

tial” or “incomplete” reinversion, in which reinverted fundal part remains intrauterine (not dropping out to the vagina through the cervical canal). If this becomes a concern, we usually employ the combination of Bakri balloon placement and holding the cervix technique [8]. Sponge forceps and Bakri balloon should be removed after 12–24 hours, when complete haemostasis is achieved [7,8].

While abdominal cavity is opened for laparotomic repositioning, as Uhlířová and Málek’s case, we usually employ uterine compression sutures after laparotomic repositioning. Any types of compression sutures may prevent reinversion, and we have long been using Matsubara-Yano (MY) suture [3,4,9]. A concern may arise: uterine penetration at compression sutures might cause adverse ischemic events to the uterus “already ischemic due to inversion”. Although this is theoretical, we propose “single transverse uterine-body suture”: only single transverse transfixation suture should be made in the uterine-body upper part (just below the fundus). This prevents reinversion. The suture is tied at the abdominal wall (not within the abdominal cavity) [10]. The suture (thread) can be removed from the abdominal wall after haemostasis is achieved, and thus thread does not remain intrauterine. This is a kind of “removable” uterine compression suture. Ischemic adverse events are expected to be less likely to occur.

In our department, the choice which of these procedures should be emplo-

yed depends on the attending doctors’ judgements. There are no controlled studies on efficacy of these preventative procedures. Considering the rarity of the uterine inversion and reinversion and its emergent nature, randomized controlled trials may be impossible to perform. We have been employing them as departmental routine procedures. After their employment, we encountered no patients with reinversion. Thus, I believe that their effectiveness is time-tested. I recommend readers to attempt these procedures depending on the situation. All the detailed procedures are described with illustrations in the cited literature.

### Acknowledgment

I previously described these techniques, which were cited. Our team touched these techniques also in other papers, which are retrievable through the articles cited here.

## Zápis z jednání volební komise pro volbu výboru Sekce kolposkopie a cervikální patologie České gynekologické a porodnické společnosti ČLS JEP

Volební komise ve složení Vít Unzeitig (předseda), Marian Kacerovský a Jan Nový se sešla dne 26. ledna 2023 a vyhlašuje následující výsledky korespondenčních jednokolových voleb výboru **Sekce kolposkopie a cervikální patologie ČGPS ČLS JEP**.  
 Volební komise obdržela celkem 65 volebních obálek, z nichž bylo získáno 65 platných hlasovacích lístků.

### Výsledky hlasování (bez titulů):

1. Radova Turyna	43 hlasy
2. Vladimír Dvořák sen.	39 hlasů
3. Lukáš Rob	37 hlasů
4. Aleš Skřivánek	31 hlasů
5. Tomáš Malík	26 hlasů
6. Jiří Sláma	25 hlasů
7. Jiří Ondruš	23 hlasy
8. Michal Mihula	20 hlasů
9. Petr Sudek	18 hlasů
<hr/>	
10. Zdeněk Rokyta	15 hlasů
11. Marek Pluta	14 hlasů
12.–13. Pavel Freytag	11 hlasů
Helena Robová	11 hlasů

Členové nového výboru byli o svém zvolení informováni a souhlasí s prací ve výboru.  
 Na prvním jednání nového výboru Sekce kolposkopie a cervikální patologie ČGPS ČLS JEP dne 6. června 2023 byl zvolen předsedou MUDr. Vladimír Dvořák, Ph.D. a vědeckým sekretářem MUDr. Tomáš Malík.

10. července 2023

doc. MUDr. Vít Unzeitig, CSc.

prof. MUDr. Marian Kacerovský, Ph.D.
